

Page 11: Not A Peer-to-Peer Electronic Cash System

July, Camp Year 11

How long is it now? 

Yours Kanamori

email is 1281

Abstract: Yours is getting shorter than a pink paper.

1. Introduction

This is not a white paper. It's pink. In other words, this paper is not real.

As you may not know, millions of Cyberslammers hold a personal relationship with a Japanese entity known as Satoshi Nakamoto, the name behind what used to be once widely circulated white paper titled "Bitcoin: A Peer-to-Peer Electronic Cash System." No, no, not.

As you read this, the entire Bitcoin thing is nullified in the future. Not just for a page/white paper, assuming you still value money.

Before you continue, there are 112 reasons to be reading this pink paper. Then again, there are 11 reasons if you have already escaped "the Time is Money Trap." How do you know if you're stuck inside "The Time is Money Trap"? If you look at your calendar and the year reads 2014, you're a slave to.

2. Transactions

Let's say you want to get with a new currency that, unlike Bitcoin, has a shot at being revolutionary. Well, it's not, essentially, not the currency. The currency lives inside you. The currency and how it moves is just a reflection of your abundance-consciousness or lack thereof. Just keep in mind, the Universe only knows abundance. There's no such thing as a lack of abundance. In the matrix, you are attached to an abundance of lack. And that keeps you stuck in "the trap". And no digits.

So you want a currency that truly lives "outside the matrix." In that case, before you proceed another penny, you ought know the best way to win all chances of revolutionary.

The best way to ensure your new currency is not a game changer is to ensure your brand new currency is deflated. In other words, give it an exchange rate or price. In other other words, if you design your currency such that anyone off the street can buy and sell your new coin for 1, all you have created something. And that something is not revolutionary. Why not? Because it, by definition, carries both the positive consciousness or the old. Go figure it, perhaps not continues.

Oh that note, nothing in this pink paper is mathematics. However, even top notch scientists don't see it.

Hey, Thanks for tuning in. You're still here, what's play with this brother.

You walk up tomorrow morning and decide to make a new currency. You call it Hipspace. You spend an hour creating a spreadsheet as you can give people Hipspace and help them track who has what.

Then, you get fancy and design the system so that that everyone who is playing with Hipspace has their own copy of the spreadsheet. In there's no central authority and everyone can see at night knowing that nobody is in control. And with a little help from AI, your fancy spreadsheet system is flawless and keeps everyone in sync. In the mean, this is known as "decentralized". You have a decentralized spreadsheet that just magically copies itself everywhere and keeps track and nobody owns it. Like a magic spreadsheet that floats about in the cloud.

Next, you order a couple of cheese pizzas from Papa John's and sell some flour. You sell 100 and as you decide, 100 Flips are worth 10000, which is nice because it reminds you of the \$100. So, like magically swapping a dollar for a paper dog, you just decide 10000 for one dog (Flips are).

Finally, you declare the game has a total of 10,000 Flips and the game is on.

Here's the next part. Find a group of people to play along. So you recruit and promise some riches. Brown, anyone can buy in to your game for 10000 per Flips. And anyone can cash out for 10000 per Flips. And, of course, the game takes off and the value magically goes up.

Of course it's going to go up. Everybody is going to love Flips. It's going to be better than the last big thing. It's going to be huge. There will be so much demand for getting in to the exciting game of Flips that, for reasons nobody can put into words, people will pay higher and higher prices to get in.

But, you decide to start handing out to look them in. It's 10000 exchange rate. Buy as many Flips as you want, give them around, then cash out. That's the game. There is, quite literally, nothing to Flips. Smoke and mirrors at its finest.

Here's where we were talking to:

There's nothing inherently wrong with the Flips approach. The Flips themselves are precisely the same as Euros and even other cryptocurrencies (except). The only difference is they (the market) affect a "market price" instead of an "exchange rate". Exchange (10000 for paper dogs) is used to get into the game, exchange paper dogs (10000 for 10000) to get out. You can see the price [here](#).

And, finally, to finish this section, the underlying technology behind Cryptos is like a big spreadsheet with some magic properties. It's called blockchain. It's not just that. A magic prohibition is the dog that grows and grows and grows forever and gets copied over and over and over to give the grand illusion that the game

has less of value. It's debt. Because would not have a call following. And we would using it does.

In all cases, as previously stated, the moment you have an exchange rate in a, you have abandoned all possibility of creating anything revolutionary. You have not invented a game change. In fact, you have not even created a new game. You have merely created a plug in extension to the third matrix OR game known as "The Game is Money Trap".

In 3D space, like any Cybercurrency, with an exchange rate is nothing new. It's just money. Which is fine. But you're still stuck inside "The Trap" that's happening along at the rate frequency.

12. Conclusion

This proof paper never gets published because it's never done. It's "living document", if you will. And even if you read it, it is located outside of Cyberpace!

This proof paper has an IP address, or rather, a 22. What frequency, so you are communicating with a glimpse of the paper at some mysterious point in Earth frequency. Thing is... it's already out of date. And this may be our last transmission.

Love and more,
Love is everything.
